# Overview

Section 1

Background Theory

# Introduction (I)

What should be a soap bubble look like?

Figure: A Real World Soap Bubble

# Introduction (II)

Figure: A Real World Soap Bubble

There are three dominant effects

- Reflection
- Refraction with high Fresnel Effect
- Thin film interference (colors)

The third effect is usually omitted by CG simulation.

# Introduction (III)

How to simulate thin film interference?

- Go deeper in physics
- Design workable approximated shading algorithm

# Fresnel Equation

The well-know Fresnel shader in CG is designed based on the Fresnel Equation.

- $R_\mathrm{S} = \frac{n_1 \cos\theta - n_2\sqrt{1-(\frac{n_1}{n_2}\sin\theta)^2}}{n_1 \cos\theta + n_2\sqrt{1-(\frac{n_1}{n_2}\sin\theta)^2}}$

- $R_\mathrm{P} = \frac{n_1\sqrt{1-(\frac{n_1}{n_2}\sin\theta)^2} - n_2 \cos\theta}{n_1\sqrt{1-(\frac{n_1}{n_2}\sin\theta)^2} + n_2 \cos\theta}$

- Reflectance as function of refractive indices ratio $n_1/n_2$ and incident angle $\theta$

- Polarization matters, $\mathrm{S}$ and $\mathrm{P}$ polarization components of lights

# Thin Film Effect

Thin film: two very close interfaces with thickness $d \sim 1000$ nm.

- Refracted light cancel or reinforce depends on the thickness-to-wavelength ratio $d/\lambda$
- Approximate effective reflectance derived by applying Fresnel equation twice
- $R(\lambda, \theta, d) = 2R_{\mathrm{P}}^2 \frac{1-\cos\delta}{1+R_{\mathrm{P}}^4-2R_{\mathrm{P}}^2\cos\delta} + 2R_{\mathrm{S}}^2 \frac{1-\cos\delta}{1+R_{\mathrm{S}}^4-2R_{\mathrm{S}}^2\cos\delta}$
- $\delta(\lambda, \theta, d) = 4\pi n \frac{d}{\lambda} \cos\theta$
- Ignore polarization (by averaging) since when don't have enough information

Figure: Thin Film Interference

# The Shading Formula

Idea: Effective reflection and transmission as if only one interface:

- $L_P(\lambda) = (1 - R(\lambda, \theta, d))L_{it}(\lambda) + R(\lambda, \theta, d)L_{ir}(\lambda)$
- Reflectance $R(\lambda, \theta, d)$ defined on the previous slide
- Wave-length $\lambda$ matters!

Section 2

The Shaders

# Color and Wavelength

The shading equation depends on wave-length $\lambda$, how can we obtain it?

- Assigning approximate wave-lengths to each of the RGB components
- R $\sim$ 660 nm, G $\sim$ 510 nm, B $\sim$ 450 nm
- Treat them differently from start to end
- Code:

```
121              uniforms: {
122                  mWaveLength: { type:"fv1", value: [660, 510, 450] },
```

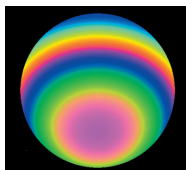

Figure: Spectral Colors

# Thickness Distribution

Uniform thickness $d$ on the surface is not physical, makes interference colors only appears when incident angles is close to 90 deg.
Simulate the thickness distribution on the globe!
Two main effects

- Drifting: by gravity
- Sloshing: by perturbation

(a) Only Drifting

(b) Add Sloshing

Code:

```
35    "float direction = fract(sin(dot(normalize(worldNormal).xy, vec2(1.0, 1.0)) * PI));",
36    "float thickness = mAverageThickness * (1.0 - normalize(worldNormal).z * direction  * mThicknessRange);",
```

# Following the Physics (I)

The major part of shaders following the physics equations.
Vertex Shader:

```
"void main() {",

"vec4 mvPosition = modelViewMatrix * vec4( position, 1.0 );",
"vec4 worldPosition = modelMatrix * vec4( position, 1.0 );",
"vec3 worldNormal = normalize(mat3(modelMatrix[0].xyz, modelMatrix[1].xyz, modelMatrix[2].xyz) * normal);",
"vec3 I = worldPosition.xyz - cameraPosition;",

"vReflect = reflect(I, worldNormal);",
"vRefract = refract(normalize(I), worldNormal, mEffectiveRelativeIndex);",

"float cosine = dot(normalize(I), normalize(worldNormal));",
"float sine = sqrt(1.0 - cosine * cosine);",
"float effectiveCosine = sqrt(1.0 - sine * sine / mRefractiveIndex / mRefractiveIndex);",
"float reflectivityS = (cosine - mRefractiveIndex * effectiveCosine)/(cosine + mRefractiveIndex * effectiveCosine);",
"reflectivityS = reflectivityS * reflectivityS;",
"float reflectivityP = (effectiveCosine - mRefractiveIndex * cosine)/(effectiveCosine + mRefractiveIndex * cosine);",
"reflectivityP = reflectivityP * reflectivityP;",

"float direction = fract(sin(dot(normalize(worldNormal).xy, vec2(1.0, 1.0)) * PI));",
"float thickness = mAverageThickness * (1.0 - normalize(worldNormal).z * direction * mThicknessRange);",

"float cosineDelta[3];",
"cosineDelta[0] = cos(4.0 * PI * mRefractiveIndex * thickness / mWaveLength[0] * cosine);",
"cosineDelta[1] = cos(4.0 * PI * mRefractiveIndex * thickness / mWaveLength[1] * cosine);",
"cosineDelta[2] = cos(4.0 * PI * mRefractiveIndex * thickness / mWaveLength[2] * cosine);",

"reflectivity[0] = 2.0 * reflectivityS * reflectivityS * (1.0 - cosineDelta[0]) / " +
"(1.0 + reflectivityS * reflectivityS * reflectivityS * reflectivityS - 2.0 * reflectivityS * reflectivityS * cosineDelta[0]);",
"reflectivity[0] += 2.0 * reflectivityP * reflectivityP * (1.0 - cosineDelta[0]) / " +
"(1.0 + reflectivityP * reflectivityP * reflectivityP * reflectivityP - 2.0 * reflectivityP * reflectivityP * cosineDelta[0]);",
"reflectivity[1] = 2.0 * reflectivityS * reflectivityS * (1.0 - cosineDelta[1]) / " +
"(1.0 + reflectivityS * reflectivityS * reflectivityS * reflectivityS - 2.0 * reflectivityS * reflectivityS * cosineDelta[1]);",
"reflectivity[1] += 2.0 * reflectivityP * reflectivityP * (1.0 - cosineDelta[1]) / " +
"(1.0 + reflectivityP * reflectivityP * reflectivityP * reflectivityP - 2.0 * reflectivityP * reflectivityP * cosineDelta[1]);",
"reflectivity[2] = 2.0 * reflectivityS * reflectivityS * (1.0 - cosineDelta[2]) / " +
"(1.0 + reflectivityS * reflectivityS * reflectivityS * reflectivityS - 2.0 * reflectivityS * reflectivityS * cosineDelta[2]);",
"reflectivity[2] += 2.0 * reflectivityP * reflectivityP * (1.0 - cosineDelta[2]) / " +
"(1.0 + reflectivityP * reflectivityP * reflectivityP * reflectivityP - 2.0 * reflectivityP * reflectivityP * cosineDelta[2]);",
"reflectivity[0] *= mInterferenceMagnifier;",
"reflectivity[1] *= mInterferenceMagnifier;",
"reflectivity[2] *= mInterferenceMagnifier;",

"gl_Position = projectionMatrix * mvPosition;",

"}"
```

# Following the Physics (II)

Fragment Shader:

```
72        "void main() {",
73
74        "vec4 reflectedColor = vec4(1.0);",
75        "reflectedColor.r = textureCube(tCube, vec3(-vReflect.x, vReflect.yz)).r;",
76        "reflectedColor.g = textureCube(tCube, vec3(-vReflect.x, vReflect.yz)).g;",
77        "reflectedColor.b = textureCube(tCube, vec3(-vReflect.x, vReflect.yz)).b;",
78        "vec4 refractedColor = vec4(1.0);",
79        "refractedColor.r = textureCube(tCube, vec3(-vRefract.x, vRefract.yz)).r;",
80        "refractedColor.g = textureCube(tCube, vec3(-vRefract.x, vRefract.yz)).g;",
81        "refractedColor.b = textureCube(tCube, vec3(-vRefract.x, vRefract.yz)).b;",
82        "vec4 color = vec4(1.0);",
83        "color.r = mix(refractedColor.r, reflectedColor.r, clamp(reflectivity[0], .0, 1.0));",
84        "color.g = mix(refractedColor.g, reflectedColor.g, clamp(reflectivity[1], .0, 1.0));",
85        "color.b = mix(refractedColor.b, reflectedColor.b, clamp(reflectivity[2], .0, 1.0));",
86
87        "gl_FragColor = color;",
88
89        "}"
```

# Summary of Observations

What we have:

- Colors! (thin film interference)
- Fresnel effect originated from Fresnel equation itself!

What we don't have:

- Only texture mapping, no good light sources (may magnify interference and Fresnel effects)
- Good simulation of transmission through the bubble (4 interfaces) (approximated by an effective refractive index $n_e \sim 1.005$ now)

Section 4

Challenges, Result, and Future Work

# Challenges and Result

Challenges:

- Deriving approximated shading equation from real physics (partially aided by reference [2])
- Assigning RGB components with different wave-lengths to simulate compound color light
- Simulating drifting and sloshing which affect thickness distribution
- Dynamic texture mapping and setting up the scene (with the help of skeleton example [1])

Result: All challenges solved.

# Future Work and Reference

Future Work:

- Adding light source
- Ray tracing
- Distortion matters
